

The prospecting problem

The opportunities are already public.

Rezoning, permits, ownership changes, distress filings, expiring leases — every site-acquisition, leasing, and management opportunity across your five-state footprint shows up in public records first. Your team doesn't have the hours to read them. **This system reads them continuously, scores each against CAM's criteria, and hands your people a short, ranked call list every Monday.** The research is automated. The relationships stay yours.

1

What the system watches

outbound · runs continuously

SOURCED FROM		
County & assessor records	Zoning & planning agendas	Building permits
Deed & loan records	Recorded comps	
Court & distress filings	Firmographics	
Signal	What it surfaces	Feeds
DEVELOPMENT · ACQUISITION · LEASING		
Rezoning filings, GPA / PAD applications, tax-delinquent or underused parcels	Land & assemblage opportunities	Site acquisition
Competitor permits pulled, infrastructure announcements	Where demand is heading before it's obvious	Pipeline strategy
Corporate expansions & relocations	Build-to-suit & pre-lease targets	Development leasing
MANAGEMENT · BROKERAGE		
Ownership change, out-of-state buyer, portfolio acquisition	New owners with no local operator	New assignment origination
Distress filings, receiverships	Assets that need a manager now	Receivership pipeline
Lease expirations across the managed portfolio	Renewals to protect before they lapse	Retention — NOI protection

2

The smart front door

inbound · website & forms

We make your front door smart.

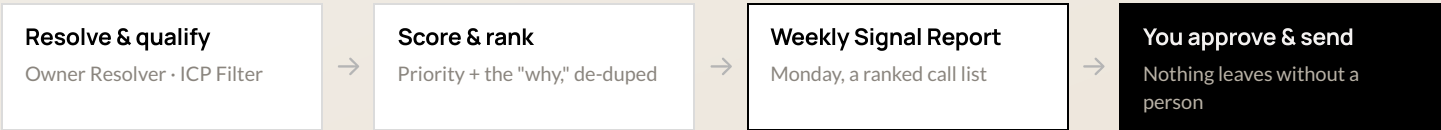

We put the qualifier where it can actually run — **your website and inbound forms**. A real prospect gets scored and routed to the right agent the moment they raise their hand, instead of sitting in a pile. No tapping phones or personal inboxes — just a smarter intake that ties straight into your website and ABM work.

Scored & routed in real time No pile — the right agent gets it first Feeds website + ABM

3

Both streams run the same engine

human-gated, always

No signal, no send.

I own the orchestration.

Your team owns the output.

Every name traces back to the signal that surfaced it — you always see why it's there. I build it, run it alongside your team, and hand it over once it's humming. **One assignment this surfaces covers a year of the system.**

Where we'd start: a four-week Phoenix industrial pilot — built to roll to your other markets.
